Context

Workable is exploring how we could help employers identify and manage fraudulent candidates during the hiring process.

Candidate identity fraud is an increasingly important concern for employers. It can create wasted review and interview time, security and compliance risks, and reduced trust in inbound applications. At the same time, overly aggressive detection can create poor candidate experiences, privacy concerns, unfair outcomes, and false positives.

Your assignment

Prepare a concise Product Requirements Document proposing how Workable could help employers address candidate identity fraud.

Your PRD should demonstrate how you would:

1. Define the problem and its scope
2. Research and explain the different forms candidate identity fraud can take
3. Identify the relevant users, use cases, and points in the hiring workflow
4. Clearly distinguish evidence, assumptions, hypotheses, and research needs
5. Conduct a basic competitive analysis
6. Consider multiple product approaches
7. Recommend one approach and explain the trade-offs
8. Define an initial scope and phased delivery plan
9. Structure the work into epics and concise user stories
10. Define meaningful success metrics
11. Identify key risks, dependencies, and open questions

You should make reasonable assumptions where information is missing and state them clearly.

You are not expected to address every form of candidate identity fraud. A strong submission will make clear choices about which problems and users to address first, and explain what is out of scope.

The assignment will be assessed based on the quality of your problem framing, research and evidence gathering, competitive analysis, product judgment, prioritization, written communication, delivery planning, success metrics, and awareness of risks.
